

Experts in Cold Storage Roofing Systems

Specialized Roof Design and Installation

When building cold storage facilities, specialized roof design and installation is critical to a quality, condensation-free building. Central among many design challenges—systems must be adaptable enough to integrate with facility components built by multiple building contractors while successfully addressing the significant vapor drive that occurs from warmer outside air toward the colder building interiors.

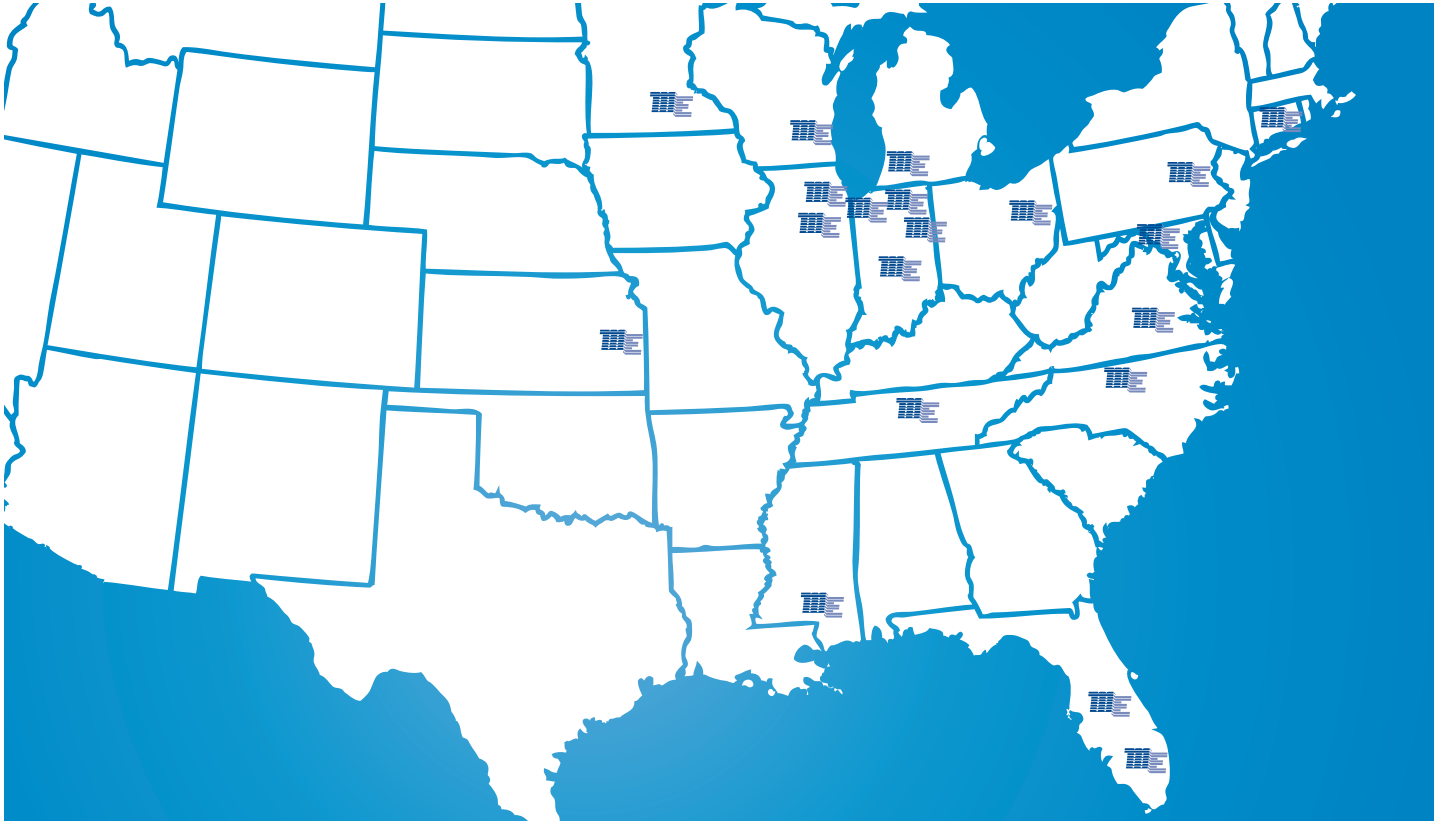

Inadequate roof design and application that is unable to prevent this air intrusion into the field of the roof can lead to costly condensation problems and higher operating costs over the life of a facility. With a specialized design installed by an experienced cold storage roofing contractor, you can expect a continuous, uninterrupted, vapor-tight thermal envelope inside your building, and a trouble-free, energy-efficient facility. For decades.

With over 40 years of experience and in excess of 15,000,000 square feet of successful cold storage installations, Midland has the knowledge and experience to provide the highest quality installation for your facility. Call us today.
